

INFORMATION SECURITY ASSESSMENT

Understanding the security posture of your organisation and identifying vulnerabilities is the first step towards protecting the confidentiality, integrity and availability of critical systems and data. Your organisation may be vulnerable to attack not just from the outside but also from the inside. The ensuing loss of public trust, failure to comply with regulatory requirements and/or loss of critical systems and data can result in severe financial repercussions.

Mobiliance can provide a comprehensive evaluation of your organisation's information security posture. Our expert consultants will document findings and provide you with prioritised recommendations for mitigating the identified risks as well as to improve the overall security architecture of your organisation.

OUR METHODOLOGY

Mobiliance's Security Assessment begins with understanding your business requirements and ends with providing you with detailed findings and prioritised actionable recommendations. A typical high-level outline will consist of the following phases:

- ◇ Review of business requirements and goals
- ◇ Review of network architecture and design
- ◇ Review of system architecture and design
- ◇ Review of relevant documentation, e.g. security policies, contingency plans.
- ◇ Risk and/or threat identification and assessment
- ◇ Vulnerability assessment (external and internal)
- ◇ Data analysis
- ◇ Report and briefing

For more information and a copy of a sample report outline, please contact us for a free discussion on how our services can benefit your organisation.

Features

- ◆ Thorough evaluation of your organisation's existing network and system security architecture, policies and processes vis-à-vis business objectives and requirements.
- ◆ Assessment of the current level of vulnerabilities of your critical network and systems infrastructure. We perform this vulnerability assessment from both within ("internal assessment") and outside ("external assessment") of your IT environment.
 - ⇒ External Assessment – We analyse your IT environment's vulnerabilities from outside of your network perimeter (e.g. firewall). This simulates access from outside sources such as the public Internet.
 - ⇒ Internal Assessment— Studies have shown that most of the security violations have occurred from within the corporate network. We perform a thorough assessment from within your IP network to simulate access by users operating from within your internal network.
- ◆ Interviews with key management and staff members to gain a clear picture of current security processes (and solutions) as well as information security requirements and challenges.
- ◆ Detailed documentation/report with prioritised recommendations and road map of remediation plan to achieve the required security posture.
- ◆ Presentation of assessment results and findings in both management
